SKILL EDUCATION
SHAPING SKILLS FOR SCALING HIGHER...!!!

Project: Choose any one from the given.

Note: You can refer to the following datasets as given as links. But, you can always find other datasets from kaggle, or any other resources.

1. COVID-19 Data Analysis and Visualization

- Description: Analyze the spread of COVID-19 over time, examining trends in cases, recoveries, and deaths across different countries or regions. Visualize the impact of government interventions on the spread of the virus.
- Dataset: Johns Hopkins University COVID-19 Dataset or Our World in Data COVID-19 Dataset.
- Tools/Libraries: Pandas for data manipulation, Matplotlib and Seaborn for visualization, and Plotly for interactive charts.

2. Global Happiness Report Analysis

- Description: Analyze the World Happiness Report data to understand what factors contribute to happiness in different countries. Visualize correlations between happiness scores and variables such as GDP per capita, social support, and life expectancy.
- Dataset: World Happiness Report Dataset available on Kaggle.
- Tools/Libraries: Pandas for data cleaning and manipulation, Matplotlib and Seaborn for visualization.

3. Titanic Survival Analysis

- Description: Perform exploratory data analysis (EDA) on the Titanic dataset to understand the factors that influenced passenger survival. Create visualizations to represent survival rates by class, gender, age, etc.
- Dataset: Titanic Dataset is available on Kaggle.
- Tools/Libraries: Pandas for data manipulation, Matplotlib and Seaborn for visualizations.

4. Air Quality Analysis

- Description: Analyze air quality data from various locations to understand pollution levels over time. Visualize trends in air quality indices and their relationship with weather conditions or public health metrics.
- Dataset: UCI Machine Learning Repository Air Quality Dataset or OpenAQ Global Air Quality Data.
- Tools/Libraries: Pandas for data processing, Matplotlib and Seaborn for visualizations.

5. Stock Market Analysis

- Description: Analyze historical stock market data to identify trends and patterns in stock prices over time. Visualize stock performance against various indicators such as moving averages or trading volume.
- Dataset: Yahoo Finance Historical Stock Prices can be accessed via the yfinance library or Kaggle Stock Market Datasets.
- Tools/Libraries: Pandas for data manipulation, Matplotlib and Seaborn for visualizations, and NumPy for numerical calculations.

Instructions:

Task Completion: Ensure that you attempt all the assigned tasks given to you as part of the exam. Complete each task to the best of your ability, following the instructions provided.

Assumptions: Make suitable assumptions wherever necessary, based on the requirements and instructions provided. Document any assumptions made in your project documentation or README.md file.

GitHub Repository: Create a GitHub repository to host your project. Upload your project files, including source code, and documentation to the repository. Ensure that you provide a clear and descriptive README.md file.

No Copying: Do not copy code or any other content from your classmates or any other source. Plagiarism is strictly prohibited and can result in severe consequences, including academic penalties. Ensure that all the code and content in your project are original and properly attributed to the appropriate sources, if applicable.

Submission: Once you have completed your project and uploaded it to your GitHub repository, submit the GitHub repository link to your instructor or as instructed. Double-check that your repository is properly organized and includes all the required files as per the instructions provided.

Remember to follow the instructions provided professionally, make suitable assumptions wherever necessary, and avoid copying code or content from unauthorized sources. Good luck with your project work!
